take an exciting Sinclair voyage...

take a look at the exciting new releases from the growing
range of **SINCLAIR SOFTWARE**

AVAILABLE ON CASSETTES OR ROM CARTRIDGES

JET PAC

You'll have to be quick on your lasers. Fast and action packed space travel.
SPECTRUM — Rom Cartridge
CX5306 **\$79.95**

PSSST!

What's up in the garden? Will you and Robie save your prize crystals from the hungry insects?
SPECTRUM — Rom Cartridge
CX5307 **\$79.95**

EARLY PUNCTUATION

One in a series of six programmes designed to make learning an enjoyable and interesting affair. While an animated match stick man marches above displayed sentences the child decides what punctuation mark is missing and where to insert it. A correct sentence results in some light relief in the form of a bottle shooting game.
Cassette
SPECTRUM 48K — Cassette
CXE19 **\$44.95**

SUPER PROGRAMMES 4

This versatile programme tape contains six totally separate fun filled games.
• Down Under • Submarines
• Doodling with Graphics
• The Invisible Invader
• Reaction • Petrol
ZX 81 (16K) — Cassette
CS33 **\$19.95**

REVERSI

Test your skill against a programme which has been described as having "Artificial Intelligence". Nine variable skill levels and full play back facility.
16K and ZX 81.
ZX 81 (16K) — Cassette
CZ56 **\$19.95**

GALACTIC ABDUCTOR

An exciting game in 100% machine code. Defend your satellites against the ferocious space hawks. Even your laser can't kill them instantly. The giant birds weave, drop their eggs on your planet and capture humanoids. Be careful, if the hawks don't get you what's in the eggs will!!!
SPECTRUM 16K — Cassette
CXS2 **\$29.95**

SINCLAIR BOOKS

GAMES TO PLAY ON YOUR ZX SPECTRUM Martin Wren-Hilton

These games are designed to test your faculties and the Spectrums facilities to the full.

Also included are a couple of programmes to help you write your own games.

BK157 **\$6.95**

DELVING DEEPER INTO YOUR ZX SPECTRUM

D Jones

When you have mastered, Introductory Programming on the Spectrum, you need this outstanding guide to Enhanced Programming Techniques.

BK611 **\$27.95**

PROGRAMMING YOUR ZX SPECTRUM Hartnell & Jones

Your ZX Spectrum is a powerful computer and this book will help you make the most of it.

From first principles right through to quite complex programming.

BK162 **\$24.95**

THE ART OF PROGRAMMING THE ZX SPECTRUM

M James

Whether you are fairly new at computing or a seasoned programmer you are likely to have a lot of questions on the theme of "How can I programme the Spectrum to do"

This book is designed to give some of the answers.
16K and 48K.

BK154 **\$7.99**

EASY PROGRAMMING FOR THE ZX SPECTRUM

Stewart & Jones

The next in the series from Peek, Poke, Byte and Ram. We take you beyond to the realms of machine code programming.

BK160 **\$19.95**

PEEK, POKE, BYTE AND RAM!

Iain Stewart, Robin Jones

This friendly guide has been designed just for you. Your ZX 81 contains everything from plugging in, to de-bugging.

BK162 **\$17.95**

Who's keeping up with Commodore?

The Commodore 64 is designed and priced so that you can pile on the peripherals. Like a disc drive, printer and even a printer plotter. You can own the Commodore 64 AND disc drive and printer for little more than you'd pay for many other computers alone.

With 64K memory, outstanding colour graphics, a music synthesiser to rival the professionals, a fantastic range of games cartridges and full upper and lower case keyboard. It's outstanding!

1541 DISK DRIVE ALIGNMENT PROGRAM

C. S. M. SOFTWARE

\$189.95

The latest software for Computers

Commodore 64, Spectrum, Sega, VIC 20 and ZX81

For those of you who have had your disk drive beat out of alignment, you may be interested in the disk drive alignment program. This disk drive alignment program requires no special equipment. No oscilloscope, no strobe light and most importantly you don't have to be a electronics wizard to use this program. The program is contained on one disk and a specially prepared calibration disk is supplied with the program. The calibration functions appear on your TV or monitor screen. Also included are instructions for a 'fix' that has prevented many disk drives from ever going out of alignment again. If you have not had your disk drive beaten out of alignment, just wait. Your turn is coming!

OUR COVER THIS MONTH IS "XADOM" BY QUICKSILVA
- SUPPLIED BY ALPINE COMPUTING LIMITED

When Eric said to me "Tom, how about throwing some more light on what is happening on the home computer scene now that you're back in London," no problems I replied and promptly bent over forwards. After spending several months in Egypt where the closest you can get to a home computer is counting donkeys droppings on doorsteps its good to be back to some relative sanity.

To give you an idea of the current consumer popularity of home computers we have compiled the following chart. This reflects what is happening in major retail outlets throughout the country:

Machine	Price(£)	Distributor
1 Spectrum	99	Sinclair
2 CBM 64	199	CBM
3 BBC B	399	Acorn
4 Vic 20	140	CBM
5 Electron	199	Acorn
6 Memotech 500	250	MTX
7 Amstrad CPC464	239	Amstrad
8 Oric	99	Oric
9 Atari 800 XL	250	Atari
10 Dragon	150	Dragon

Interestingly enough although CBM have announced profits up by 57% to \$33 million (US), accounted for by a raise in overall sales of 86% over previous years boosting the total sales figure up to \$1.3 billion (US) it turns out that Sinclair has had proportionally a larger percentage of sales with the Spectrum as the best seller as the above chart backs up.

On the chart you may have noticed the name Amstrad. They are a company well known in the UK for producing a long line of cut price electrical goods. With the CPC 64 which incidentally has; a 64K memory available for basic, built in cassette deck, joystick & printer interfaces, an excellently set out key board and a basic that can be summed up as easy to us. Sold as a complete package the unit for its £239 cost includes a monochrome monitor or alternatively for £349 includes a colour monitor. At current market prices to set up a comparable system with a CBM 64 would cost approximately £ 450. The Amstrad CPC464 is certainly value for money and hopefully the poeple of NZ will see it soon.

An idea of the competition that is ever present in the UK market place

can be shown by the Atari 600XL and the CGL (SORD) M5 computers.

The 600XL launched barely a year ago to replace the ageing 400 & 800 micro's is presently being sold for £100 in many major retailers, a reduction of £50 for the original asking price. The same situation occurs with the CGL M5 and its current market price of £49.95, a reduction of over £100.

In the UK research has shown that generally people when buying computers have no idea what they are buying and more often than not buy purely on heresay or word of mouth. First time buyers it has been found, find it more helpful to go to a home computer shop for advice and thus make their purchase. People in business, Managing Directors etc, also find it helpful to visit Home Computer Shops before making a Business Computer purchase. Generally what is done is they purchase a Home Computer and examine its capabilities and limitations in the business scene so as to get a more educated insight into what is necessary for their particular needs. I certainly hope we NZ'ers are a bit more switched on

Why Teachers Like Computers

The success of the VIC 20 and Commodore 64 is not simply a matter of salesmanship and price but a combination of software availability and adaptability, after-sales service, continuity of supply, reliability and simplicity.

Software has to be specific to the current curriculum and this is the responsibility and objective of these involved in the promotion of Commodore in education.

Teachers need software that enables them to write instructional aids for particular lessons and allows students to write their own programs to consolidate learning:

A summary of what educationa-lists consider to be the uses to which computers could be put includes:

- A tool of developing general thinking and problem-solving skills (computer assisted instruction).
- A tool for teaching (computer based instruction).
- An essential for preparing students to live in a world dependent on technology and information.
- A stimulus for consideration of the impact and implication of computerisation on society.
- To teach computer science.
- An administrative tool for calculation of records, word processing collecting, maintaining and utilising information.
- A motivator as part of the learning process.
- A tool to record and diagnose results.
- A remedial aid for specific learning problems.
- A teacher with infinite patience.

*WIN A PRINTER FOR YOUR HOME COMPUTER!! COMPUTER INPUT COVER COMPETITION

Entries close 15th November 1984

All you have to do is design the cover for the December 84 Computer Input cover.

It must be A4 size (297mm x

210mm).

The lettering "Computer Input" & "NZ's No 1 Home Computing magazine" must appear somewhere

on the sheet.

So get those ideas into us before the closing date and add print-out capability to your computer.

Here are a few of the entries we have received so far:

CRAIG TICKELPENNY- TE AWAMUTU

DAVID GILBERT — RANGIORA

GREG TICKELPENNY - TE AWAMUTU

MATTHEW DWYER — DUNEDIN

* We have changed the prize (from that started previously) because most of our readers have got a computer anyway!

Eric's Answers

Dear Sir,
I am making 3D machine code games for my ZX-SPECTRUM, so I was wondering (and hoping) if you by any chance have a machine code routine for scrolling sideways on the spectrum, please!!!

Kent Ferguson.

Perhaps there may be a reader out there that can send an answer into us to help Kent.

Dear Ed,

I have a 16k Spectrum and I would like to know if any of your readers in the Howick, Pakuranga area have one as I would like to swap some software with them. I also have a problem, could you please tell me if there is any way in which I can check how much Memory I have left when I'm in the middle of typing in a program?.

Robert Hooker

P. Hopkins

To find memory used on ZX81 peek the system variable E-LINE subtract 16509 and divide by 1024.

ED.

Dear Sir,

I have found an error in the 'AUTO RUN' program listed on page 16, in Sega Input, of the May/June issue. It skips programs instead of touching them. To make it run your readers could add this line:

45 POLE &H82A2, O

This sets the program found flag to O, a 'found' value.

Miles Tooney

Dear Eric,

First up, let me compliment you and your staff on a great mag, however it could be greatly improved (as well as getting a wider readership) by including a column for pocket computers and calculators as used in serious applications maths, electronics etc as these can't be beaten for fieldwork where a TV and 240 V are not available. As most of your program listings are games (nothing wrong with that!!) one would have to conclude that your mag is aimed at the ex-fun parlour crowd!! What a waste of kiwi talent, expertise

etc. Games come and go (Rubiks' cube for example) and Game magazines are two-a penny. If you doubt that go down to your local book stockist sometimes. I'm sure serious users and game players can co-exist in one magazine, there may even be an overlap at times!!! Your comments please.

L Burne

ED.

EX-FUN PARLOUR CROWD! how dare you! No, seriously, Computer Input is New Zealand's Home computing magazine — whatever that involves at any one time. Games, yes, but I'm sure you'll find a wealth of serious information between our covers to. As you say, games are good, but don't let that fool you, home computing is a serious thing. It has already surpassed other types of computing in many other countries, its just a matter of time before N.Z. realises that. (except for our readers who already know it!).

Yes, we would like to support all facets of home computing (ie pocket computers and calculators). Again, send in your own material, and let's get the ball rolling.

Dear Eric,

I have an expanded VIC 20 and I was wondering if it is possible to use 'user defined graphics' with a 16k.

I have tried myself to achieve this, but have always met with failure. Perhaps you or an astute reader could volunteer a programme which accommodates this.

Yours to enlightened.

Craig Webster

ED.

See "Programmable Characters for the VIC 20" — Computer Input July page 31 by M. Vickers.

Dear Eric,

Congratulations on your great magazine! I always look forward to reading it.

I have two things to ask of you:

1. Can you tell me when the first edition of "Program Input" will be published.
2. Could you please review the "Sega SC-3000."

Looking forward to your reply!

ED

1. PROGRAM INPUT is available now (actually published in June) at only \$1 a copy — send your order to
COMPUTER INPUT
P.O. BOX 39-278
AUCKLAND WEST

2. We have reviewed the Sega SC 3000 in our November issue.

Dear Eric,

I have a Vic-20 with 16k ram. I have considerably long loading games on my computer and wondering if I could transfer these games to cartridge instead of waiting ages for them to load from cassette. Can I?.

Also how about starting up a 'Vic Input' or a 'Commodore Input'? I know many people who own Commodore computers and would be very pleased if you did so.

Also after seeing Wayne Jeffery's letter I think you should start an 'Adventure Input' or something to help adventurers like myself. Last of all John Osbornes trick doesn't always work on my Vic-20 with or without my 16k ram.

Tim Davey

ED.

Yes you can transfer any program to cartridge, but, the cost & hassle involved in doing it makes it impractical. It would be cheaper and better in the long run to buy a disk drive.

Yes, we would love to have a regular Vic and 64 input, and will do in the future however our magazine is your magazine so send your own material in and get the balling rolling.

Adventure Input — ditto!

Eric

hardware review

This month's Hardware Review is a round up of some of the more recent Home Computers on the market at present (obviously we couldn't review every computer).

Reviewed are:

Commodore 64, ORIC, ZX81, Spectrum, Apple IIe, BBCB, VIC 20, Sega SC3000, JR100, Spectravideo 318, 328, Atari 600XL, Atari 800XL, Acorn Electron, VZ200, Cat, Colour genie, Sharp MZ700.

Z80 MACHINE CODE

PART 3

By S. Burity

ABSOLUTE JUMPS

In BASIC when a routine is to be repeated more than once you don't write the routine many times, you GOTO the start of the routine for the number of times required. In machine code there is a command similar to GOTO, it is JP NN. What this does is to make the machine code program continue from address NN.

Where NN is the address to jump to. This is worked out using the method described in part 1. If $N + 256 * N = 1000$ then the program would go on and on forever always loading A with 5. So what we need are commands that operate if the last result calculated was equal to 0 and not equal to 0 these are JPZ NN and JPNZ NN.

Since $A \text{ would } = 0$ the jump would be done.

JPNZ NN - Jump to NN if the last result calculated was not 0.

The jump would not take place as the last result ie A-B would not equal 0. So now we have the following jumping commands.

BASIC	Z80 ASSEMBLER	CODE
GO TO NN	JP NN	195 NN
IF RESULT = 0 THEN NN	JPZ NN	202 NN
IF RESULT (0) THEN NN	JPNZ NN	199 NN

RELATIVE JUMPS

These are small jumps forwards and backwards. They jump N bytes forward and 256-N bytes backwards using JR.

This would jump over bytes 0, 1 and 2 from N and land on byte 3. So for relative jumps forward start counting the number of jumps forward from the second byte after N.

For backward relative jumps it is more complex.

For backwards jumps count from N and subtract the number of jumps from 256 ie $256 - 4$ jumps (including the number itself) = 252.

The test for 0 and not 0 can also be used for relative jumps.

EXAMPLE

ADDRESS	Z80 ASSEMBLER	CODE
1000	1d A, 5	625
1002	JP NN	195 NN

EXAMPLE:

```
1d A, 1
DEC A
JPZ NN
```

EXAMPLE:

```
1d A, 5
1D B, 4
SUB A, B
JPZ NN
```

EXAMPLE:

```
JR 3 — N
BYTE 0
BYTE 1
BYTE 2
BYTE 3
```

EXAMPLE:

```
BYTE 1
BYTE 0
JR 252 — N
```

Perfect Peripherals to expand your system from Dick Smith Electronics

Xidex Quality Diskettes

The new Xidex range of precision disks offer a level of quality and reliability previously unknown. Better disk substrate, finer particles in the coating, ultra-smooth polishing, tighter tolerances and an extra 18 critical tests ensure that all disks easily exceed the ANS 1 specs for 96 TPI high density recording.

Single sided, double density soft sector
Cat X-3510 \$6.50 each
Box of 10 Single Sided, d/density soft sector
Cat X-3512 \$65.00
Box of 10 Double Sided, d/density soft sector
Cat X-3514 \$85.00 box

Keep your drives clean and error free!

Disk Head Cleaning Kit

One area often overlooked is your disk drives. For longer life and absolute reliability, they should be cleaned at least once a week. These handy items make head cleaning easy.
Cat X-3517

\$24⁹⁵

Replacement Disk Insert
Cat X-3518 \$6.95

Store your Disks in this quality

Diskette Library

Even at our low prices, you should still treat your disks with care - especially if your company's financial records are on them! This disk library holds and protects up to 10 diskettes in their jackets, in an upright position for easy use. Can be closed for storage. A cheap investment.

Cat X-3502

\$4⁵⁰

Budget Daisywheel Printer

If you're using your computer for word processing, this daisywheel printer will give you top quality printing at a budget price. Prints at 18 cps. Offers a choice of 3 pitches (10/12/15 cpi) plus proportional. Takes standard 96-character print wheels and ribbon cartridges (Diablo/Queme compatible), paper up to 330mm wide. Very quiet too; only 58dBA. Standard Centronics-type interface suits most popular computers.
Cat X-3270

\$1135

Ribbon cartridge for X-3270 Printer
Cat X-3271 \$19.95
Tractor feed attachment as shown above
Cat X-3273 \$195.00

BX-80 Dot Matrix Printer

The BX-80 offers high quality, speedy dot-matrix printing at a price far lower than comparable printers. Bi-directional, prints the full upper and lower case (with true descenders) ASCII character set at 80 cps, with four character widths: 80 columns, 254mm wide either single sheet (friction feed) or fan-fold (sprocket feed). Prints bit-image graphics (640 dots/line), responds to ESC code sequences for software control. Standard Centronics type interface suits most popular computers.
Cat X-3268

\$795⁰⁰

Ribbon cartridge for X-3268 printer
Cat X-3269 \$19.95

High Resolution Green Monitor

Even with a colour computer, you may prefer to use a green screen monitor instead of a colour monitor - especially if you're using it for business. This high-resolution green monitor has a 30cm screen and 18 MHz bandwidth, giving a bright, sharp display, even on 80-column text and hi-res graphics!
Cat X-1220

NZ113/LL

Z80 ASSEMBLER	CODE
JR N	24N
JRZ N	40N
JRNZ N	32N

Checking 2 Bytes variables for 0

METHOD:

Z80 ASSEMBLER	CODE
1d A, H	124
or L	181

If both H and L were 0 the test for 0 would true. I won't explain the use of "or" all that matters is that it works.

The same could be done for BC and DE.

Z80 ASSEMBLER	CODE
OR B	176
or C	177
or D	178
or E	179
or H	180
or L	181

SOLUTION TO THE PROBLEM

Z80 ASSEMBLER	CODE
1d HI NN	33 NN
1dBC NN	1 NN
1d(HI) N	54N
INCHI	35
DECBC	11
1d A, B	120
or C	177
JRNZ 248	32 248
RET	201

1dHI NN HI = start of the display file.
 1dBC NN BC = number of characters to be printed.
 1d(HI) N print character whose code is N.
 INCHI HI points to the next print position
 DECBC BC = BC - 1
 1d A, B
 or C

JRNZ 248 if Bc > 0 then go around again.

RET - return to BASIC.

ZX81 owners will have to make the following alterations:

- 1) Use 1d HL (12 64) to find the start of the display file.
- 2) Make the program avoid the newline characters if you don't do this the program will crash.

You now have the commands to write many machine code programs. In my next article I will explain more commands which are not necessary but are very useful.

**SATELITE
SOFTWARE
LTD.**
 P.O. Box 7259,
 WELLESLEY ST,
 AUCKLAND

N.Z.'s NEWEST software distribution company.

We are dedicated to bringing low priced N.Z. Produced Software and peripherals to the N.Z. public.

We're on the lookout for N.Z. programmers.

If you are interested in getting your Software distributed in N.Z. while making money into the bargain, then contact us -

We'll do the rest.

THE FORBIDDEN ZONE

for the Sega SC3000

PART ONE: STRANDED IN SPACE

This is an armchair adventure. You suddenly find yourself transported to a damaged spaceship somewhere in another galaxy. In order to complete the adventure, you must give commands to your faithful obedient robot(!). These commands are single words, a sample of which can be obtained from typing 'h' when the game starts. All commands are entered in lowercase. Part one takes you towards the city of Doom.

PART TWO: THE CITY OF DOOM

This is a continuation of part 1. You must enter the city of Doom by finding the secret passage way. Having entered the city, you must find and obtain valuable fuel for your damaged spacecraft. Once this has been achieved, you must make your way out of the city undetected.

PARTS THREE AND FOUR WILL BE AVAILABLE FOR RELEASE SHORTLY.

Each adventure contains high resolution color graphics. Commands are single words such as GET, INVENTORY, KILL, LOOK, HELP and are typed in lowercase. All adventures will run on either LVIIIA/B machine, and are supplied on a high quality C10 cassette.

Each part available on cassette for only \$16.95 (Inc Postage and packaging)

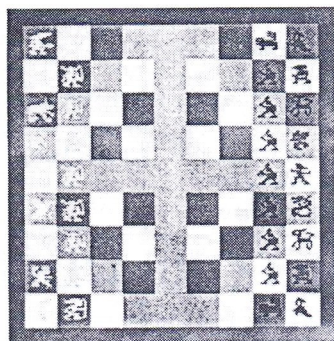

We accept Bankcard & Visa.

PROGRAM OF THE MONTH

ARCHON

by ELECTRONIC ARTS

C.64

Archon

Archon depicts the eternal struggle between light and darkness as a contest of action and strategy between opposing forces.

The light side and the dark side are equal in number and balanced in strength, but not identical. Their aim is to eliminate the opposite side or occupy the 5 "power points".

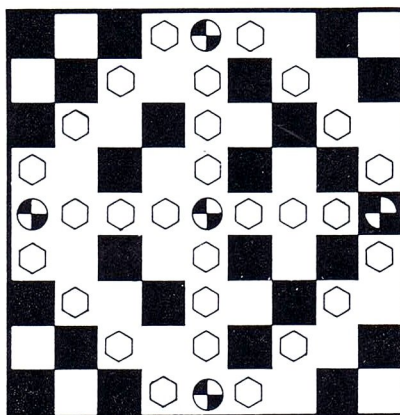

Archon is played on two different Screens. On one, the strategy screen, you and your opponent take turns as in a game of chess manoeuvring your pieces into favourable positions. When you place your "Icon" on to a square already occupied by your opponent's Icon the game shifts temporarily to the "combat arena screen". The disputed square expands to fill the entire screen and the two Icons controlled by each opponent's joysticks have to fight for that square.

(Archon's strategy screen changes. While some squares are always white or always black others vary from black through different colours to white in a continuous cycle. Your fortunes in the game tend to be relative with the cycle because the light side is stronger on light squares and the dark side stronger on dark squares. (4) Exchange any two pieces. (5) Summon elemental which can attack any opposition but vanishes after the battle win or lose. (6) Revive any Icon previously killed in combat. (7) Imprison any opposition e.g. if a white Icon is imprisoned he cannot move off his square until the squares turn white.

In the combat arena each Icon has different fighting skills. The Knights and Goblins fight on foot with sword and club other Icons can fire fireballs, arrows, etc, and can fly or walk.

Archon is one of the better games we have received to date. You can either play against the computer (which is very hard to beat) or against a friend.

Visual ****
Sound ****
Program ****
difficulty ****
overall *****

Each Icon is a little bit different than another except the Knights and the Goblins these are similar to pawns in chess there are: On the light side, a wizard 2 valkries 2 golems 2 unicorns a phoenix and DJINNI on the dark side a sorceress 2 banshee 2 trolls 2 Basilisk a dragon and a shapeshifter. The wizard and the sorceress both have magic spells. (1) They can teleport other pieces to different squares. (2) Heal any Icon of all wounds. (3) Shift the flow of time

THE COMBAT ARENA

Our Ratings are:

● VISUAL:

Based on the use of graphics, colour, special effects, and special features.

● SOUND:

Based on skillful sound effects, musical variation, and complexity of the notes used.

● PROGRAM:

How well written, and how well it exploits computer capabilities.

● DIFFICULTY:

Levels of skill required, degree of interest, and time to complete the game or each stage.

● OVERALL:

We review programs of a wide price range, rating each on value for money, interest, and overall presentation.

- * Hopeless
- ** Sub-Standard
- *** What we would expect
- **** Very Good
- ***** Exceptional

LABYRINTH

Bayswater
Auckland.

SPECTRUM

This is a great 3 dimensional maze game.

The object of the game is the find your way out of the maze.

If while trying to find your way out and you are completely lost then you can get some help by pressing the 'H' key. Once you have pressed the key the screen will clear and you will be shown a plan of the maze. This will also indicate your position in the maze. However, the plan will only remain on view for a short period of time and you are only given access to the plan 5 times.

Once the game starts you will be given a three dimensional representation of the maze as you would see it. This view is governed by the direction in which you are looking. You can look lighter North, South, East or West. When you move you move one place forward in the direction you are looking. The keys for looking in different directions are:

West	South	North	East
5	6	7	8

As indicated by the arrows above the keys. Press 'O' to move one place forward in the direction you are looking. Press 'H' for Help.

CAT Input

Unfortunately, the listing for the "80 cent" Project from last month was left out. If you haven't already written your own software, here is a simple Program to graph light intensity.

```

10 HGR 5
20 HCOLOR= 4
30 FOR X = 0 TO 279
40 Y = PDL (0)
50 IF Y > = 191 THEN Y = 191
60 HPLLOT X,Y
70 NEXT X
80 GOTO 10

```

PFS:FILE is a very easy-to-use information management system for the CAT or Apple Computer.

Basically, PFS:FILE works like a paper filing system, without the paper. But unlike a conventional filing system, FILE lets you record, file, retrieve and, most important, use your information in ways that are just not possible with paper and a filing cabinet.

The form and it's function.

With FILE, you organize your information in "forms" you create yourself right on the computer screen.

Once you've designed the basic form—with spaces for all the necessary data—all you do is fill in the blanks.

What's more, if you find you'd like to change your original form design, FILE lets you change just the form, without having to re-enter the information on it.

Getting at the information you need FILE lets you retrieve the specific information you're looking for in a variety of ways so you get just the information you want and nothing else.

For example, you can get all the information that is 'less than', 'more than', 'equal to', 'between', 'not', or any combination you choose.

Once you've made your choice, FILE will display, one by one, all the forms that contain information matching the criteria you specified.

As each form appears, you can update it if necessary by typing in new information, or print it with a few simple key-strokes. FILE even lets you sort and print selected items such as names and addresses for a mailing list.

PFS:FILE is available from Dick Smith Electronics
Cat. No X7610 \$239.95

Rectangles and Squares

Rectangles and Squares can easily be displayed by using the **DRAW SQUARE** command. The variables which must be defined are the co-ordinates of the first and third corners. To **DRAW** a hollow yellow square at the top left of the screen and with sides of length 20, you would need to run Program 1.

On line 40 the co-ordinate 0,0 sets the location of the first corner and 20,20 is the co-ordinate of the 3rd corner of the square.

The **PAINT** command allows a closed area on the screen to be filled with one of eight colours. The starting point, boundary colour and **PAINTING** colour must be defined. If you add line 50 to program 1 you will see the effect of the paint command.

```

10 REM PROGRAM 1
20 HGR 5
30 HCOLOR= 4
40 DRAW HSQUARE(0,0 TO 20,20)

50 PAINT (10,10),5,4

```

Software Review - "Reach for the Stars"

Available from Dick Smith
Electronics. Cat. No X7700 \$59.95

"Reach for the Stars" is a fast-paced, exciting challenge for up to four players. If fewer players are available the computer can provide a graduated variety of opponents. At your choice, each computer operated Empire will compete at beginner, experienced or veteran level.

Initially, your empire consists only of a single partially developed planet. By exploring neighbouring star-systems you discover which planets are most suitable for colonization. Planetary characteristics include population size, industrial capacity and social environment in addition to a basic classification determining its suitability for human settlement. Colonization must be carefully planned as those planets with the greatest industrial capacity often come with a hostile environment. Only a considerable resource investment will make such planets

more habitable.

As industrial development proceeds throughout the four expanding Empires, it becomes inevitable that contact is made. Those players who have balanced their economic growth with both a proper regard for planetary defense and the acquisition of an adequate starship fleet will be in the best position to exploit these initial contacts.

Now comes the planning of full-scale military operations. A large starship fleet is the prime requisite for a successful campaign. However, occupation forces must be assembled for planetary invasions if heavily populated enemy systems are to be quickly overcome.

The scope of operations provided by the sophisticated, yet simply structured game mechanics is immense. Fast, machine language programming ensures no lost time as the computer instantly responds to every instruction. A set-piece scenario is provided with a constant galaxy of 54 star systems, the planetary components of which vary from game to game. Length of play

is variable and can be saved at any point.

In addition a menu of interesting options may be added at the players' request. These include alien intervention, plague and natural disaster, variable galaxy configuration (with the facility to name your own systems on colonization) and automatic production for those players who wish to concern themselves with purely military matters. Victory is assessed in two ways. Firstly, points are awarded each turn for increases in population, industrial expansion, occupation of enemy planets and starship battle victories. Secondly, each player is required to select one of these victory criteria as his prime aim with the consequence that he or she will receive a premium on the points awarded for achieving that condition.

Such decisions are kept secret from other players and, as you will readily appreciate, exert a profound influence on your long-term strategy.

VZ200 Input

If you are using programs with DATA lines, why not use the VZ200 capability by a subroutine that will use new data to create revised data lines, as follows:

```
100 DATA 56
110 INPUT A
120 READ B
130 C = A + B
140 PRINT C
150 PRINT "100 DATA";C
```

Now CSAVE and the next time the program is used (once you have moved the cursor up to the last printed line and entered) the new data will be in the program.

With a FOR/NEXT loop, the theory can be applied to extensive programs. For example, you can use it to update top scores in games programs, or to update a budget program.

From Paul Vowles comes this program to produce amazing pictures of 3D pyramids on your VZ200. Without doubt, this is one

```
10 REMARKABLE PYRAMIDS
15 REM BY PAUL VOWLES
20 CLS:INPUT "PYRAMID HEIGHT";H
22 INPUT "LENGTH OF BASE";B
25 D=B/2

1050 SET{X,Y}:N=N+1
1060 IF A1<0 THEN Y=Y1+N/A1
1079 NEXT X:RETURN
```

Gordon Woolf.

In the mail came this letter from David Jones. He has found a number of functions which I'm sure other users will find interesting.

I've discovered with the sound command that it can use the following format:

SOUND 4,3:16,3:28,3:16,8:4,8 and so on... On the subject of arrays I have noticed that they are not restricted to three dimensions as suggested in the manual... Also, although the book doesn't mention it, one can use integer variables such as A%, B% and C% etc. This

speeds up processing since the system doesn't have to handle floating point maths for that particular problem...

I have been experimenting with the system to try to determine it's memory map. I found the range of addresses between hex 6800 and hex 6FFF are not fully decoded and all address the same functions. They address the visual display generator, the tape in and out ports, and the sound generator. POKEing dec 1 or 32 to any of these locations will cause a sound to be made (POKE 1

then 0 then 1 then 0 etc to cause tone, and vary the gap between POKEs to change the pitch). POKEing 8 or decimal 16 to these locations will cause the screen to change modes and background colours. POKEing 4 then 0 then 4 then 0 etc will cause an output on the tape out line, and PEEKing these locations will show that the decimal 64 bit changes when a tape is played in. As yet, I haven't discovered what the last two bits are for, but I suspect that they cause a foreground colour change.

VZ200 Expansion Board

Construction Details:

The eight input and eight output decoders used in this project were wire-wrapped on a piece of 100x120mm wire wrap board. A board this size enables some of the other expansion projects to be built on it.

Commence construction by drilling a small hole in each corner of the

board for the four spacers. Position a 16 pin 1C socket in the top left hand corner of the board and glue it in position. Leaving a 5mm gap place the 14 pin 1C socket parallel to the 16 pin socket. The last two sockets should be positioned as shown in fig. 1.

Socket A is for the 1C plug which

connects to the VZ200's printer port. Connect 16 pieces of 200mm hookup wire to each of the pins of the 16 way 1C plug. Next month we'll give the printer port connections and details on the 1C pin connections.

Parts list:

- (1) 100x120mm wire-wrap board
- (1) 14 pin wire-wrap 1C socket
- (3) 16 pin wire-wrap 1C sockets
- (4) 30mm spacers
- (1) 16 pin 1C plug

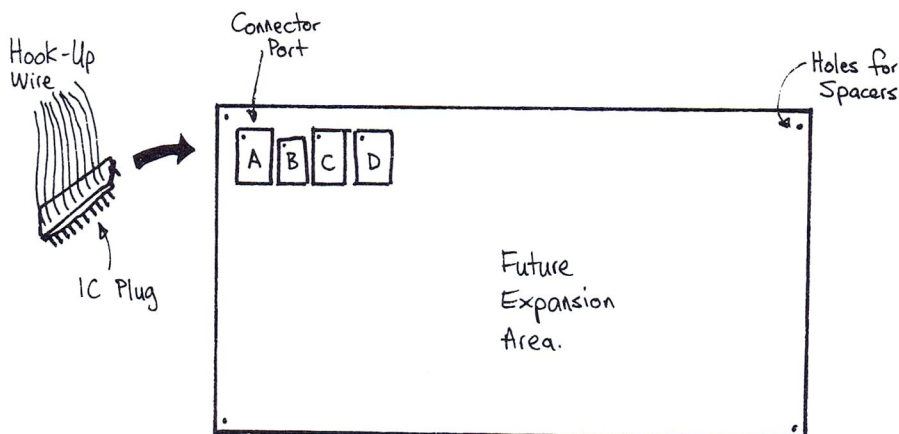

FIGURE ONE.

BRAIN TEASER CROSSWORD

The closing date for this crossword is **OCTOBER 30th** so theres plenty of time to get those entries in.

The winner will receive a "Computer Input" package which includes:

- 1) Software program of your choice to the value of \$40 (must be available in NZ.)
- 2) Free "Program Input" magazine
- 3) Computer Input Tee Shirt

So lets see those entries!

DOWN.

1. To Return to previous stage of cyclic process (7)
2. Too MANY of these could slow the operating speed of your programs (3)
4. An abbreviation of "binary digit" (3)
5. The computer displays information requested once an

7. Locating errors in Software (9)
8. Close group of similar things (7)
9. The unit of a computer used for all manual communication with the computer (7)
11. Computer Input is a publication (5)
13. Device which physically transports some recording medium (5)

16. The science dealing with the formal principles of reasoning (5)
19. MID\$ (16 Down,3) + LEFT\$ (5 Down,1) + RIGHT\$ (21 Down,1) (3)
20. A detailed plan (3)
21. To place a desired value into a storage location (3)
22. Finnish (3)

JULY SOLUTION:

BRAINTEASER CROSSWORD WINNERS

April '84- Martin Beadle, New Lynn
May/June- Dimetrios Stylianon,
New Lynn.

ACROSS

1. The difference between the upper and lower limits of a function or quantity (5)
3. Meaningless data present in any storage device (7)
6. The result of multiplying two factors (7)
9. The nerve centre of any digital computer system (3)
10. Used in programming to enable

12. An operation in Boolean algebra also known as the logical product (3)
14. A logic dement operating with binary digits (3)
15. The study of the relationship between symbols and their meaning (9)
17. MID\$ (8 Down,1) + MID\$

- (8 Down,2) + MID\$ (8 Down,4) (3)
18. A mathematical function (3)
20. Any combination of characters and symbols designed to communicate information (7)
23. The process of electronic computing (7)
24. A device performing the function of addition using digital signals (5)

This Year . . . don't buy your children a gift, buy them a future!

Your children are the most precious investment you can ever make. So it makes sense to give them the best possible start in life.

And in 1984 that means making sure they know how to handle a computer. Because only the computer literate will make it in the decades to come.

The new Sharp MZ721 Home Computer is the ideal Family Computer for you. Go along and see it, you'll be convinced, we are.

SHARP MZ721 HOME COMPUTER

- Large 64K Bytes of Ram
- Full Size Keyboard
- Plugs into your TV
- Expandable
- 4 Colour Printer/Plotter (Optional)

- Includes Built in Cassette Recorder
- Large Software Selection Available
- Program in Basic/Pascal or machine Languages

Available from Authorised Sharp Stockists throughout NZ

SOFTWARE REVIEW

In the Software Review section we review new games and utilities that become available for sale in New Zealand. However, there are hundreds, if not thousands, of existing software programs in use in New Zealand. What we want is for you, the reader, to review any software that you already have, for some of the "Golden Oldies" are still amongst the best.

We would like your views, for who would know better than the person who has paid out hard cash.

If possible, please use our format for reviews, with a brief description of the software and your overall conclusion.

We will publish the facts about any software or hardware that seem to be (by owners statements) at either end of the scale. So if you bought a game that turned out to be a complete waste of money or a program that kept you up all night (or even an average one), I'm sure the rest of New Zealand would like to know about it.

Our Ratings are:

- **VISUAL:** Based on the use of graphics, colour, special effects, and special features.
- **SOUND:** Based on skillful sound effects, musical variation, and complexity of the notes used.
- **PROGRAM:** How well written, and how well it exploits computer capabilities.
- **DIFFICULTY:** Levels of skill required, degree of interest, and time to complete the game or each stage.
- **OVERALL:** We review programs of a wide price range, rating each on value for money, interest, and overall presentation.

- * **Hopeless**
- ** **Sub-Standard**
- *** **What we would expect**
- **** **Very Good**
- ***** **Exceptional**

Sega SC3000 ASTRO DEFENCE

As the Sole Survivor of the stricken Earth Battle Ship "universe", you must try and destroy the vicious Z arrog bleet before they destroy you. All you have left is your trusty "H-cannon".

This game makes full use of the Segas graphic capabilities and sound. You use your joystick in port one to line up the enemy with your sights and fire button to shoot. You are sitting behind your starships screen battling off the never ending invasion force. When you fire, 4 laser beams home in on there target and if successful the invading ship is destroyed. There are 5 enemy ships attacking at one time and one of them every so often fires at you. Your battle ship "universe" has a force shield which can only withstand 20 hits but as the game progresses and the more enemy ships shot down your force field gains strength. If you are not successful in your mission your starship spectacularly disintegrates.

This game is one of the all familiar space invader type. The space ships come down from the top of the screen as you "shoot-em-up". Quite good though. The game is done in machine code and is very fast.

Sega SC3000 The forbidden Zone Series

These are a series of 4 adventure type games each on a cassette of there own.

PART ONE: STRANDED IN SPACE

This is an armchair adventure. You suddenly find yourself transported to a damaged spaceship somewhere in another galaxy. In order to complete the adventure, you must give commands to your faithful obedient robot(!). These commands are single words, a sample of which can be obtained from typing 'h' when the game starts. All commands are entered in lowercase. Part one takes you towards the city of Doom.

PART TWO: THE CITY OF DOOM

This is a continuation of part 1. You must enter the city of Doom by finding the secret passage way. Having entered the city, you must find and obtain valuable fuel for your damaged spacecraft. Once this has been achieved, you must make your way out of the city undetected.

PART THREE: BANDITS GALORE

The saga continues as you make your way back to your ship. Fighting off fiends, and the royal guards who now know about your plans to escape, you must safely transfer the fuel to your ship. When you cross the river of acid you will be ready to start the final race for survival.

PART FOUR: THE FINAL CONFLICT

The final part of forbidden zone, you will be required to repair your ship, and escape the dreaded forces of the forbidden zone which have lain dormant, secretly watching your adventure. Now, they rise up in one last almighty effort to prevent your escape. Can you, using the wisdom of the fool, escape in one piece!

PARTS THREE AND FOUR WILL BE AVAILABLE FOR RELEASE SHORTLY.

Each adventure contains high resolution color graphics. Commands are single words such as GET, INVENTORY, KILL, LOOK, HELP and are typed in lowercase. All adventures will run on either LVIII/A/B machine, and are supplied on a high quality C10 cassette.

These games are very good if you like adventures. Each movement or action you make is supported by a graphics screen picture to give you a good idea of what is happening.

SUNRISE SUNSET INTERLUDE
SINGLE KEY ENTRY
COMMANDS,
SPECIAL hint sheets are available for each adventure. These list common problems with solutions.

BITS & PIECES

NUMBER SYSTEMS

From time to time we read mentions of "Hexadeciaml" and "Binary" in articles in Computer Input. What do they mean? Well, lets' dig a little deeper into the beauty of numbers and at the same time find out what our history and mathematics teachers didn't tell us.

We can all count in decimal, can't we?. Perhaps you should just try, quietly, counting up to ten. O.K., hands up everyone who started "one, two, three ...". Go to the bottom of the class. That's the way we were taught, but a more correct count would be "zero, one, two ...". The concept of zero is very important in computer usage, and it might have helped the Roman Empire last a little longer. The Romans had no way of arithmetically expressing nothingness, and that together with the problems of even adding two numbers in the roman number system, made life very difficult for them.

DECIMAL

Let's pull our familiar decimal counting system apart and see how it works. Take a decimal number such as 428.75.

We know that this is four hundred and twenty eight point seven five. We start at the digit to the left of the point and say that this is the number of units, the next digit left is the number of tens, the next is the number of hundreds and so on. To put it another way, the 8 in the above example is the number of 10 raised to the power 0 ($10_0 = 1$). The 2 is the number of 10 raised to the power 1 ($10_1 = 10$) and the 4 is the number of 10 raised to the power 2 ($10^2 = 10 \times 10 = 100$). As we move left through the digits, we are "weighting" the number by increasing powers of ten. As we move right, the weighting decreases. To the right of the decimal point, the 7 is 7 times 10 raised to the -1 ($10_{-1} = 1/10_1 = 1$) and the 5 is 5 times 10 raised to the power -2 ($10^{-2} = 1/10^2 = 1/10 \times 10 = .01$).

The central concept is that a digit means different amounts of whatever you are counting depending upon its position with respect to the decimal point.

The numbers 3 and 33 both use the same digit, but imply very different quantities.

In the decimal system, the number we raise to a power -it's called the "BASE" - is 10. But 10 is not the only possibility. Any number can be used, but common sense says we should choose a base that offers a particular advantage for our application. There have been serious suggestions that for everyday use a duodecimal system -Base 12- would be better than a decimal system. Twelve is divisible by two, three, four and six and so would make arithmetic easier to handle. And if it has ever adopted, feet and inches and shillings and pence would make a big comeback! The base of a number system does not have to be an integer. In engineering and science, a base of 2.71828... is used in Napierian logarithms, which also crop up in Basic, usually as the function LOG (X).

BINARY

Deep down inside your computer the electronics take the form of switches. Now switches can be either on or off, and that suits the electronics because it's easy to detect an on or off, but a half-on is much more difficult to detect. Since we have two possible states, let's give them symbols. Off we will assign the symbol "0" and to on we will assign a "1". So now, with a single switch we can represent the two numbers zero and one. What do we do if we want to represent the decimal number two?.

The answer is that we are forced to use a second switch. We turn switch two on and switch one off to represent decimal number two. The two switches are now symbolically represented by "10". Don't confuse it with decimal ten, it is said as "one zero" and it equals decimal two.

We are building up a number system in which the units column has a weighting of one (it always does, no matter what the number system is), the "Power One" column has a weighting of two, and the next column, power two, will have a weighting of four. The base number which satisfies this is 2, so we have a number system based on powers of 2, and it's called the Binary System.

Let's convert decimal 428.75 to binary and see what it looks like. Do the integer part first, the part to the left of the decimal point. Find the highest power of two that is less than the number. In this case, $2_8 = 256$ but $2_9 = 512$, so 2_8 is the one we want. Subtract this number, and then go through the process again until the subtraction gives zero.

Einstein's theories on choosing a micro computer

Choosing a micro is a daunting task for the new-comer and with an ever increasing number of micros emerging on the New Zealand market. Even up-grading, say, from a ZX81 can be a risky and expensive exercise with the wrong decisions made. At Einstein Scientific Ltd, we believe it is important to look at the real facts and specifications, and check exactly what you get for your money before choosing your micro computer system.

THE PIT-FALLS.

Don't buy a games machine.

Unless you want games and nothing else! With a games computer you are limited. Some computers, however, have the advantage of both games facility plus the whole world of computing to explore as your interest and skills develop. A real computer system will allow you to expand your knowledge of the high technology world, and help earn its keep with its added uses in the field of education, home, business use and communication.

Software.

Make sure the system you choose has a growing library of support software, to enable you to realise the full potential of your machine.

Check the quality of the product.

Low quality components and bad design will seriously affect the reliability of the end product, and lead to false economy. Watch out for unreliable edge connectors, corrosion and poor PCBs. Make sure that your supplier can provide an after sales service in case of product failure.

Don't let the add-ons add up.

A number of outlets are offering packages that seem to be good value at low cost. Unfortunately these offers have a hidden sting in as much as the essential accessories such as power supply, peripherals and

software often carry a very high cost premium. Make sure you get an 'all-up' price to enable you to start operating the system. Software for low cost hardware usually costs between \$50 and \$100 for a ROM cartridge.

KEY POINTS TO LOOK FOR. Computer language.

It is too difficult to programme a computer in its binary language so high level languages are used, the most popular being BASIC. However, there are a number of basics, some being very different from the rest. A de facto standard in the computer industry is Microsoft BASIC. Learn this and you will be able to programme in the majority of computer basics, such an important point if the home computer is to be used to educate your children to face the technology of the future.

Expansion.

As your interest and knowledge of computing grows you will need a computer system that will grow with you, able to accommodate printer, disk drive, joystick, communications modem and colour monitor as well as produce Hi-Fi sound effects.

Software.

The computer you choose should have a growing selection of utility software to make the most of its capabilities. Remember, computing is here to stay. You can't learn to compute on a toy or a device that does not behave like a real computer.

High resolution colour.

In general most home computers have a poor graphics resolution (or detail). Check on the vertical and horizontal resolution in graphic mode and multiply the two numbers together — if the result is less than 35,000, then the graphics can hardly be considered high resolution. Low resolution graphics displays, such as those used in games, tend to be "chunky" in appearance.

Keyboard.

For accurate entry of programmes and data into a computer it is important that the keyboard has a good tactile feel and operation. A standard computer keyboard layout will familiarise the user with the vast majority of computers which are used in the world of business and professional applications, very important if the purpose of purchasing the computer is educational.

RAM (Random Access Memory).

One of the most important features of a computer is the amount of RAM, or memory included. In general, the more powerful and exacting a computer program, the more RAM it requires. But take care, all computers are advertised quoting the total RAM used in the system. Computers use up a great deal of their own RAM for storing essential data, in particular supporting the graphics display and the CPU (central processing unit). If it is less than 32K, think again, is it enough?

In short look out for a computer which offers all the points above and you will be sure of getting good value for money.

	Partial	Binary Number
$428 \cdot 2^8 = 428 \cdot 256 = 172$		10000000
$172 \cdot 2^7 = 172 \cdot 128 = 44$		11000000
$44 \cdot 2 = 44 \cdot 32 = 12$		11010000
$12 \cdot 2^3 = 12 \cdot 8 = 4$		11010100
$4 \cdot 2^2 = 4 \cdot 4 = 0$		110101100

Continue this process with the fractional part. Don't forget the binary point in the answer!

$.75 \cdot 2^{-1} = .75 \cdot .5 = .25$	110101100.1
$.25 \cdot 2^{-2} = .25 \cdot .25 = 0$	110101100.11

As you can see, to represent a decimal number slightly greater than 400 takes eleven digits in a binary number system. It can get quite unwieldy. Whilst it is perfect for computers because the number system parallels the way the electronics are used, it is not easy to look at a number and know what the value is, or even to remember the number. So for us mere mortals, the binary system is not a good choice.

HEXADECIMAL

What would happen if we were to group the binary digits into fours. The number of combinations available with four binary digits is sixteen, so we are converting from a base two system to a base sixteen system. Base sixteen is called Hexadecimal.

You may have noticed that in each number system we need symbols to represent the numbers from zero to one less than the value of the base. So for a binary system, base 2, we need the symbols 0 and 1. We could use any shape, perhaps) to represent zero and @ to represent one, but it makes sense to borrow from those familiar decimal symbols. What do we do for a hexadecimal system, which needs sixteen symbols. Well, when we run out of decimal symbols at 9 we start using the alphabet, so we can draw the following table of number equivalents.

DECIMAL	HEXADECIMAL	BINARY
0	0	0
1	1	1
2	2	10
3	3	11
4	4	100
5	5	101
6	6	110
7	7	111
8	8	1000
9	9	1001
10	A	1010
11	B	1011
12	C	1100
13	D	1101
14	E	1110
15	F	1111
16	10	10000
17	11	10001
.	.	.
28	1C	11100
.	.	.
32	20	100000

Incidentally the hexadecimal equivalent of decimal 17, which is written as 11 is NOT said as eleven. It is one-one. Eleven, and other number such as sixteen, imply a decimal system. To make it even clearer is speech, we often talk about "one-one hex" or "hex one-one."

Now let's see what happens to our awkward binary number if we convert it to hexadecimal. Decimal 428 is equivalent to binary 110101100. Starting from the binary points, divide the number into groups of four digits, to get 1 1010 1100. The conversion to hexadecimal is done independently on each group,

and from the table the hexadecimal number is 1AC. It looks a little strange at first but it is easier to say, write and remember. They do exist, but it's not normal to encounter numbers with fractional parts in systems other than the decimal, so what could be an embarrassingly difficult part of the conversion between systems rarely occurs. It is perfectly legitimate to convert from decimal to hexadecimal directly, following the rules for binary conversion but using powers of sixteen instead of powers of two.

A number system that was popular in the old days (about six years ago!) but which is seldom seen now, is the Octal system, which is based on powers of eight. You can derive an octal number from binary by dividing the binary number into three digit groups rather than the four digit grouping we used for hexadecimal.

All the arithmetic processes can be applied to any number base system, it's perfectly permissible to add two hexadecimal numbers together for instance.

The numbers to be combined arithmetically should all have the same base - you shouldn't subtract a binary number from a decimal number! The rules for arithmetic are exactly the same whatever the base. For instance in hexadecimal:

$$A + 7 = 11$$

"A", which is 10 decimal, plus 7, is 17 decimal, which is 16 + 1, which converts to 11 hexadecimal. With experience, you can add and subtract hexadecimal numbers without converting them to decimal.

What use is all this? First of all, if someone asks you how many you can count up to on one hand, you'll be able to make it to thirty one rather than five by treating each finger as binary digit. More importantly to programmers, an understanding of the binary and hexadecimal number systems is necessary before you can make too much headway with machine code. And with machine code, you're REALLY programming.

EXPLORING THE SEGA THE VISUAL DISPLAY PROCESSOR.

This month we have a look at the Visual Display Processor (VDP). The VDP is mapped at two port locations, &HBE and &HBF. These ports are the means by which the central processor communicates with Video Ram and VDP chip.

VIDEO RAM. The Video Ram (VRAM) is located of port &HBE. The processor can write or read the VRAM via this port. The programmer must use VPOKE or VPEEK to access the VRAM, POKE and PEEK access the normal user memory section of the computer, which stores only the program and variables.

TEXT SCREEN. The Text screen is comprised of 40 characters per line, and 24 lines of text. This means that a total of 960 characters may be displayed on the screen at any one time. Each character is made of a grid or matrix of 6 by 8 dots (pixels). The display used is called a "Memory Mapped display". This means that each character displayed on the screen has a specific location in which it is stored. The text screen starts in VRAM at &H3C00 and extends all the way to &H3FC0. Looking at the first line of the text screen and the address's being used:

1st character = &H3C00 2nd = &H3C01 40th = &H3C27

These locations may be poked with values between &H20 and &HFF (32 255 decimal). Try the following program which illustrates the moving of a character along the top line of the screen by using the VPOKE method.

```
10 SCREEN 1,1: CLS
20 CH=&HFF5: REM spaceship
30 FOR X=&H3C00 TO &H3C27
40 VPOKE X,CH
50 BEEP: VPOKE X,32
60 NEXT: STOP
70 REM Line 50 erases the ship
80 REM by poking a blank.
```

This could be used to develop a game where objects are moved about the screen etc, as an exercise, try rewriting it without the VPOKE commands and then compare the size and execution speed of the alternative program to the one above.

STRUCTURE OF THE VDP.

The VDP chip comprises eight (8 bit) write only registers, a read only (8 bit) status register, and an autoincrementing (14 bit) address register. A REGISTER is temporary storage device, which stores information for later use. The VDP uses these registers to find information regarding whereabouts the display information is located in Video Ram.

Register 7: Register 7 holds the COLOR for the writing/background combination. (&H12 gives black on green, more about this soon).

THE STATUS REGISTER: The SR is used for the TIME\$ command, and sprite collision detection. The VDP generates a pulse every 20 milliseconds, this pulse is used by the Z80 central processing unit (CPU) or micro-computer to update the value of TIME\$. SPRITE COLLISION DETECTION has already been covered in a previous SEGA INPUT column. However for those of you that missed the issue, here is the program again.

```
10 SCREEN 2,2: CLS
20 PRINT "Sprite collision demo."
30 FOR DE= 1 TO 1400: NEXT DE
40 PATTERNS#1,"FFFFFFFFFFFFFFFF"
50 PATTERNS#2,"FFFFFFFFFFFFFFFF"
60 SPRITE 0,(120,20),1,14: C=1
70 FOR X= 0 TO 255
80 IF (INP(&HBF) AND 32) = 32 THEN
GOSUB 120
90 SPRITE 1,(X,20),2,C
100 IF INKEY#="" THEN GOTO 100
110 NEXT X: STOP
120 CURSOR 20,10: PRINT CHR$(5)
130 CURSOR 20,10: PRINT "Collision"
140 BEEP: C=4: RETURN
```

COMPUTER BOOKS

EASY GUIDE TO YOUR MACINTOSH

Next best thing to having your own personal expert to coach you step by step. "One Minute Recipes" serve as quick reminder for all steps. Everything you need to know is here in jargon free style.

SYBEX \$38.95

POWER UP-KIDS GUIDE TO COMMODORE 64

Probably the earliest followed the most attractive book yet for kids - Learn how to draw pictures and designs, play games, change colours and slopes, create "movies" and much more.

& CATALOGUES.

The part of the program which actually detects for a sprite collision is

```
80 IF (INP(&HBF) AND 32) =32 THEN etc
```

This checks to see if any two sprites on the screen overlap by a single pixel (dot on the screen). If the two sprites do, the value returned from port &HBF will be equal to 32, so 32 AND 32 is always 32, so the THEN statement in line 80 is executed. If the value from port &HBF was equal to 128, then 128 AND 32 is equal to 0 (if you don't believe me try PRINT 128 AND 32) so the program continues on with line 90.

UPDATING A VDP REGISTER:

Two bytes are required to update or write to a register.

- Byte 1 is the required data
- Byte 2 is the required register

There is a ROM routine at &H2C54 designed to do just this. Load register C with the register number (0 - 7), load register A with the data to be written, then call &H2C54. This routine will write the data to the specified register.

EXAMPLE: Change the colour information of the text screen by directly writing to VDP register 7 using a ROM call.

```
10 SCREEN 1,1:CLS
20 PRINT "Black on Green"
30 FOR X = &HA000 TO &HA007
40 READ A : POKE X,A : NEXT
50 FOR DE = 1 TO 300 : NEXT
60 CALL &HA000
70 PRINT "Green on Black"
80 GOTO 80
90 DATA &H3E,&H21,&H0E,&H07
100 DATA &HCD,&H54,&H2C,&HCD
```

On return to Basic, ie after pressing break, you notice that the screen reverts to the original colour combination, black or green. This is because the Basic language gets the colour information for the text screen from address &H9339 in reserved RAM. The same result can be achieved by typing POKE &H9339, &H21.

WRITING TO VRAM: This was covered in a previous article. Simply load the HL register with the screen address than call the ROM routine at address &H2C44. Once that is done, you can output the value to port &HBE.

Note that the HL register of the Z80 microprocessor is loaded with the text screen address of &H3C14 in line 80 (the data 14, 3C). This is actually the 20th character on the first line, equal to &H3C14.

READING FROM VRAM: Load the HL register with the value of the address in VRAM that you desire to read, then call the ROM routine at address &H2C32. The data can then be read by inputting the value from port &HBE.

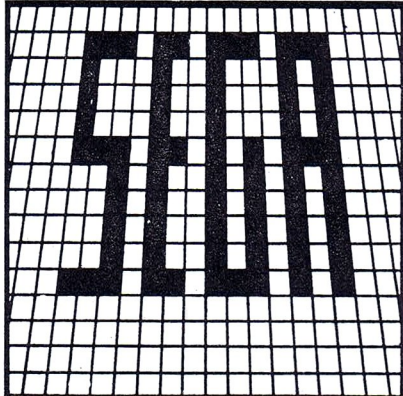

THE VDP REGISTER CONTENTS.

	Bits	7	6	5	4	3	2	1	0
Register 0		0	0	0	0	0	0	M3	VDP
Register 1		16K	BLK	IE	M1	M2	0	SIZ	MAG

SPRITE ATTRIBUTE TABLE: At location &H3B00-- there are four bytes per sprite. These four bytes have the following characteristics. Sprite 0 occupies &H3B00 to &H3B03, Sprite 1 occupies &H3B04 to &H3B07 etc.

EC. Early clock bit. When a logic 1, the sprite is shifted 32 pixels to the left.
 COLOR. 4 bits which control the colour of the sprite.

Postal Order Postal note

SPRITE PATTERN GENERATOR TABLE: At location &H1800 the eight by eight bit patterns of each sprite are stored. (ie, when you use PATTERN) Sprite 0 pattern is stored in locations &H1800 to &H1807, Sprite 1 in locations &H1808 to &H180F etc. Because the text patterns are also stored here, whenever the screen commands are used (ie SCREEN 1, 1), the contents of this VRAM area is saved in a buffer so that when the screen reverts back to normal, the original patterns are unchanged.

This is because the user will want either sprites or text patterns in these locations, but not both.

ERASING CHARACTERS ON THE GRAPHICS SCREEN: Try the following program:

```
10 SCREEN 2,2:CLS
20 FOR X=1000 TO 1050
30 CURSOR 150,0:PRINT " Score:";X
40 NEXT
50 END
```

After a couple of prints, you can't read the score at all. The way to overcome this is by using a print CHR\$(5) command. This erases everything to the right of the current cursor position. Modify the program to that below:

```
10 SCREEN 2,2:CLS
20 FOR X=1000 TO 1050
30 CURSOR 150,0:PRINT CHR$(5)
40 CURSOR 150,0:PRINT " Score:";X
50 NEXT
60 END
```

The score is now readable for all values of X, instead of the previous shambles. The PRINT CHR\$(5) in line 30 allows you to print in the same position twice. Note however, that the PRINT CHR\$(5) statement erases all information to the right of the cursor (except sprites). Its use must therefore be limited to close to the right hand edge, ie for displaying scores, etc, otherwise it would erase part of your pictures or graphic displays.

A LITTLE PROGRAM TO CHANGE ALL PRINTS TO LPRINT: This program demonstrates how handy it is to know how the actual Basic commands are stored in memory. From previous column, you have seen that the commands are stored as a single value (sometimes two values) in memory. The actual code for a PRINT statement is &H91, while a LPRINT statement is represented by &H92. This program searches through your program, and whenever it finds a PRINT statement, it replaces it with a LPRINT statement. The routine in lines 10 to 24 actually does this. The rest of the program is purely for demonstration.

```
10 AA=PEEK(&H8162):AB=PEEK(&H8163)
12 AC=(AB*256)+AA:AD=AC-65536
14 FOR X=&H9001 TO AD
16 IF PEEK(X)=&H91 THEN 20
18 NEXT:STOP
20 IF PEEK(X+1)=ASC("''") THEN
   POKE X+1,&H92
22 IF PEEK(X+2)=ASC("''") THEN
   POKE X+2,&H92
24 GOTO 16
30 SCREEN 2,2:CLS
40 PRINT "This is a test"
50 PRINT "Bye."
60 END
```

Lines 10 and 12 determine whereabouts the program ends in memory, while line 16 checks to see if the memory location contains a PRINT statement. If it does, the program branches to lines 20 24 which check to see if PRINT statement is followed by ", indicating that a text message does follow. If this test passes, is the program does find a ", then the PRINT statement is replaced by an LPRINT statement. All other lines of the program are tested, till finally the program stops in line 18. When you run the program, and it stops in line 18, LIST the program and you will see that all PRINT's have changed to LPRINT. The very same technique could be used to find variables and print on the screen as to what line numbers they occur in etc. Thats all for this month, Happy Hacking!

16KZX81

Yahtzee

Julian Smith

WARKWORTH

This is my version of the dice game "Yahtzee" for the 16K ZX81. It can easily be adapted for the ZX Spectrum or the TRS80. When typing it in please note the following points:

1. All text printed at location 16,0; is 64 character spaces long. This ensures that each message completely covers the previous statement.
2. The dice have to be placed in a certain order for the scoring to work, hence subroutine 400.
3. I have used inkey\$ rather than input to make sure people who know little about computers cannot stuff it up by typing incorrect things. This can be very easily altered.
4. Line 610 is the ZX81 equivalent of a Data statement. Alter this to suit your own machine.
5. Many subroutines can either be omitted or altered to speed things up to suit the user's preference.

Duckshoot

T. Johnson

KAIKOHE

In this program you control a man using ↑, ←, → and spacebar (fire) to shoot at ducks flying overhead. Instructions are included in the program. If you find shooting directly upwards too easy, delete line 550. In the interests of speed "Duckshoot" moves the duck sprite by V poking into the video ram the ducks X co-ordinate (&H3B01). This is much faster than using the "Sprite" command, especially when changing only one co-ordinate.

REWARDS

Dear Sir,

I have spotted an error on page 29 of the May/June issue. Lines 40, 146 and 3146 incorporate a "GOSUB 8000", but there is no line 8000 anywhere in the program.

M. Penwill

In the July issue of "Computer Input" ZX Spectrum Pattern Program.

Line 145, 495, 600, 1260, 3070, 3080 uses GOTO 150 statement. But there is no LINE 150 in the program.

ED NOTE

On most computers a jump (GOTO or GOSUB) to a line that does not exist gives an error. However the Sinclair ZX81 and Spectrum computer do allow you to do this.

```
eg. 10 GOSUB 1000
    20 PRINT "FINISHED"
    30 END
    1001 PRINT "SUBROUTINE"
    1002 RETURN
```

This program does actually work on the above computers — strange eh!

Dear Editor,

Having just bought my first home computer, I rushed home, keen and eager to try Nigel Irwin's Galaxians program on page 2 of the magazine which A.V.M. gave me for free.

I keyed it in, removed my one fingered typing blunders, and watched by two young video games addicts, observed yellow sprites banging and firing their way across the screen in front of a starry night sky. Oh the power of home computers!

While the space pilots were pressing buttons I had a closer look at the program, and have found 4 distinct queries or mistakes.

1. We tried the Z key, the X key and the N key and observed results, but the M key produced nothing. In line 150 RS is tested for "M", but never filled, so $0 = 0 + 5$ is never executed — probably just as well, as 0 has no restrictions to keep it within the

bounds of screen size. Line 150 is unnecessary, never executed, and therefore a program mistake.

2. Line 140 puts a random number into D, but D is not used in any other part of the program, so this line is also a program error.

3. Line 210: $T = P + 6T$ is not used in the program between line 130 and the end, so this statement is also excess garbage.

4. In the loop which places the coloured stars randomly in the sky, lines 30 to 80, one statement is in the wrong position.

60 PSET (K, L), T places a star at position K, L, calculated in lines 40 & 50, with colour T, not calculated until 70. If line numbers 60 and 70 are exchanged, this will be correctly ordered.

Congratulations on your new magazine I am eagerly looking forward to more SEGA programs to try.

Jay Jackson

Dear Sir,

I have found a error in the harbour program written by John Perry for the sega (July issue). The problem arises when you've finished your first game and started your second. Once it has drawn up the screen your plane crashes automatically. This is because the variables for damage haven't been changed from the last game. To fix this add on too the end of line 1700 "HP= 0: DTH = 0".

Also once you get onto the second round "next round" isn't erased from the screen. By deleting 'GOTO 1334' will fix this.

You can also prevent waiting 15 seconds for a second game by adding ":BLINE (0,161) - (255,19),BF" at the end of line 1428 and deleting "GOTO 10" at the end of line 5690 and adding "BLINE (102,90) - (160,99),BF: GOTO 1331".

Theres also an error in the tank program written by K. Dwen. After playing a few games of tank the program crashes on a 'Gosub nesting error'.

William Lau

Dear INPUT,

In your 16K ZX81 listing of "Moon Patrol" out of your May issue of Computer Input there is an error. When I run this run this program an error sign 2/580 appears after the printing of the screen, I have not been able to find the error but the program certainly doesn't work. Also some the strings were unreadable.

I also do not understand how to enter the machine code routines for the ZX81 which were printed in the April edition of your magazine.

Could you please send me more information about the machine code routines and the "Moon patrol" program. Thank you!

Robert Rowan

Dear Sir,

While typing in the program "Pattern Program", which appeared in the July issue of "Computer Input" for the ZX Spectrum, I found a mistake.

It appeared in lines 483 a 551. They read:
DRAW 120,3", a. They should read:
DRAW 120,32, a.

Michael McDowall

Error in July issue of "Computer Input" page 35 Russian Roulette program.

LINE 160 READS
160 PRINT: PRINT "How many wish to play (up to five)" : : INPUT A

The line should read
160 PRINT: PRINT "How many wish to play (up to five)." : : INPUT A

Peter Young

Dear Computer Input,

I believe I have found a small mistake in the program 'Jackpot' for the Sega SC 3000 (July Issue). In line 500 it says "..CURSOR 60 150.." There should be a comma between 60 and 150.

Chris Robinson

BUYSELLSWAP

Free to all our readers (ONE ENTRY ONLY!)

I would like to get hold of some BBC games. I would swap them with listings of Fisherman Fred, Asteroid Chase, Holy Grail, School of Death, Breakout, Solitaire, Stuka, Connect four, Bertie, and more besides. I am especially interested in arcade and adventure games. If possible, could they be sent on either tapes or listings. Programs I would be really interested in are: The Hobbit (from Melbourne House), Zalaga (from Hardvark Software), Orion (from Software Projects), Pharoh's Tomb (from A & F Software) and The Valley (from ASP Software).

“NZ MICRO ”

Club has existed since 1977, and was formed to develop and foster interest in all aspects of the microcomputer.

Club activities include an annual exhibition, a computer bulletin board system and regular computer workshops in which members have an opportunity to investigate and solve any problems they may have with their microcomputers.

An annual subscription fee of \$12.00 is levied, payable half yearly or annually. This fee also covers all

members of a family. For school students the membership fee is \$6.00 per year. A member is entitled to receive a copy of 'NZ MICRO', our bimonthly club magazine, and access to the club library which holds current copies of most computer magazines, and is entitled to purchasing discounts available through our club purchasing officer.

The club encourages the formation of user groups by members of the club who have specialist interest. Several such groups exist, and hold

meetings on a monthly basis. Details of these groups are available from the club secretary, or from the club magazine.

Club meetings are held on the first Wednesday of each month starting at 7.30 pm. Generally a talk is given on some aspect of microcomputers, and there is an opportunity to meet and exchange ideas with other members. Workshops are held the following Saturday from 10.00 am to 5.00 pm. The address is 107 Hillsborough Rd, Mt Roskill.

JUMPMAN

The ALIENATORS have infiltrated JUPITER headquarters and planted bombs throughout its thirty levels. Only by scaling the many ladders, girders and perilous ropes that provide access to the hidden interiors and mystery mazes of Headquarters, can you reach every bomb. As JUMPMAN, you must fight off the Alienators' bullets, robots, dragons, birdmen, flying saucers and other demonic destroyers. Even if you escape the clutches of these villainous fiends, beware of crumbling girders and vanishing escape routes.

Should you avoid the Alienator, climb to the top and try to work your way down, or try to hurdle him and defuse the bombs closest to you before they go off? The choice is yours. But be careful, you may mistime your jump and find yourself dangling from a ledge with your seven lives a mere memory.

WHATEVER YOUR TASTE...

WHAT GOOD IS THE LATEST TECHNOLOGY IF YOU CAN'T AFFORD IT?

Congo Bongo

Champion Tennis

Monaco GP

Music

BUT NOW, AT ONLY

\$399

YOU CAN.

The best technology at the best price. That's the Sega promise. So, if you want to know what state-of-the-art really means, familiarize yourself with the new standards of performance set by Sega.

The latest Sega SC 3000 will keep the family entertained for hours with its vast selection of arcade games. Enjoy the challenge of these thrilling games, recreated on your own TV screen with colourful, high-definition, quality graphics.

The streamlined keyboard ensures the easiest operating ever for those itchy trigger fingers. And if all the famous arcade games aren't hard enough, you can even programme your own.

Because the Sega SC 3000 is a computer, not just a video games machine, its other diverse uses include being an invaluable educational tool. A means of creative expression. Even an indispensable financial organiser.

Imagine how much more readily children will study their school subjects with the help of the SC 3000. Or how inspired any enthusiastic artist will be by the musical and 16 colour, graphic cartridges available.

And your Sega SC 3000 can grow with your family's changing needs. Joystick, printer and cassette deck are just some of its many low-cost expansion capabilities.

Seeing is believing, so don't buy a home computer without seeing the Sega SC 3000 first. You'll be convinced that you need look no further.

TAKAPUNA NORTH**

We will keep this competition open until a winner has claimed the prize which is a Computer Input Tee Shirt.

So send in your chest size as well.

PROGRAM OF THE YEAR

Of the programs published for the past 7 months we have been selecting the program of the month, for the Program of the year Competition.

Each program will be judged on graphics, sound, setting out level of difficulty etc. (The computer used will be taken into account).

**The prize will be a
DICK SMITH
'CAT' for
christmas.**

The "program of the month" this month goes to Richard Haggart of Auckland for his program **Labyrinth** on the Spectrum Computer.

The "program of the year" entries so far are:

Peter McCarrol - Lower Hutt - Nov 1983
Pat Poland - TE AKAU - Dec 1983
Paul Bonnington - Palmerston North - Feb 1984
David Parrott - Rotorua - March 1984
Derek Richards - Papakura - April 1984
David Palmer - Rotorua - May 1984
John Perry - Auckland - June/July 1984
Richard Haggart - Auckland - August 1984

**NEXT
MONTH**

Next month is our Anniversary issue! Yes, we are now 1 year old! We overview the ATARI 600XL, is it what it's cracked up to be!

We also carry on our regular features - on the Sega, Z80 machine code and color genie plus articles for the C64, VR100, the Cat, VZ200 and spectravideo. We feature two great games - 'Magic Mansion' for the 16K ZX81 by David Gilbert and 'LUNAR' for the Sega by William Lau.

This is going to be our best one yet! Don't miss it!
